

## 2. Monoploids following X-irradiation of the pollen.

Tester  $lg_1 gl_1$  was crossed with pollen of inbred C13A irradiated at levels of 1000, 2000, and 4000 r. Monoploids were less frequent in the 3804  $F_1$  seedlings of the treated group than in the control population of comparable size.
