

## 2. Additional sources of cytoplasmic sterility.

Ten different sources of pollen abortion controlled by the cytoplasm are being transferred to a series of tester lines. So far, none of these have differed clearly from the S or T types. Il53 and W22 seem to be the best inbreds to differentiate between S and T types of cytoplasm. Il53 restores T but not S. W22 is a partial restorer for S but has no ability to restore T.
