

IV. REPORT ON MAIZE COOPERATIVE

Stocks of several hundred reciprocal translocations have been maintained during recent years by Dr. D. S. Robertson at Iowa State University. Last summer the periodic task of increasing a portion of these was shared. About 65 translocations from this series were increased at Urbana, and an approximately equal number was grown at Ames. It is hoped that during the next few years fresh seed of this entire group can be obtained for permanent transfer to our collection.

Increases were made last season of Chromosome 6, 7, and 8 stocks, primary trisomics, and unplaced genes. Miscellaneous other stocks needing increase or upgrading were also grown.

During 1964, 1614 seed samples were supplied in response to 95 requests. Of the total, 1390 samples were distributed within the U.S. (86 requests) and 224 samples were sent to foreign countries (9 requests).

The following catalogue of stocks represents a complete listing of available stocks, with the exception of reciprocal translocations listed in the 1962 and 1964 Maize Newsletters. Requests for seed or for copies of stock lists should be sent to E. B. Patterson, S-116 Turner Hall, Agronomy Department, University of Illinois, Urbana, Illinois.

Chromosome rearrangements

The following rearrangements are being maintained primarily for use in determining the chromosome locations of new traits. All are marked with closely-linked endosperm or seedling traits.

The cytological positions of Inv 2a were determined by Dr. Morgan; those of Inv 9a were determined by Dr. Li. The indicated interchange points of the reciprocal translocations are taken from published work of Dr. Longley.
